

## INSTALLATION GUIDE

# Zen Track

12 steps, made simple.

### Before you start

Installation involves connecting to your electrical supply. Work must be carried out by a licensed electrician in accordance with Singapore regulations. Always isolate the circuit at the distribution board before you begin, and do not restore power until installation is complete.

### STEP 01

#### Unbox your Zen Track

Open the box and check the contents: the track, two end caps, retaining clips and mounting screws. Confirm the length matches your order before you begin.

### STEP 02

#### Mark and mount the retaining clips

Hold the track itself against the wall as a straight guide, with a spirit level on top to keep it level. Mark the clip positions, then fix the retaining clips to the wall.

#### NOTE

Mounting on a concrete wall? Pre-drill and plug the wall before driving the screws, so the retaining clips fasten securely.

### STEP 03

#### Unscrew the entry-side end cap

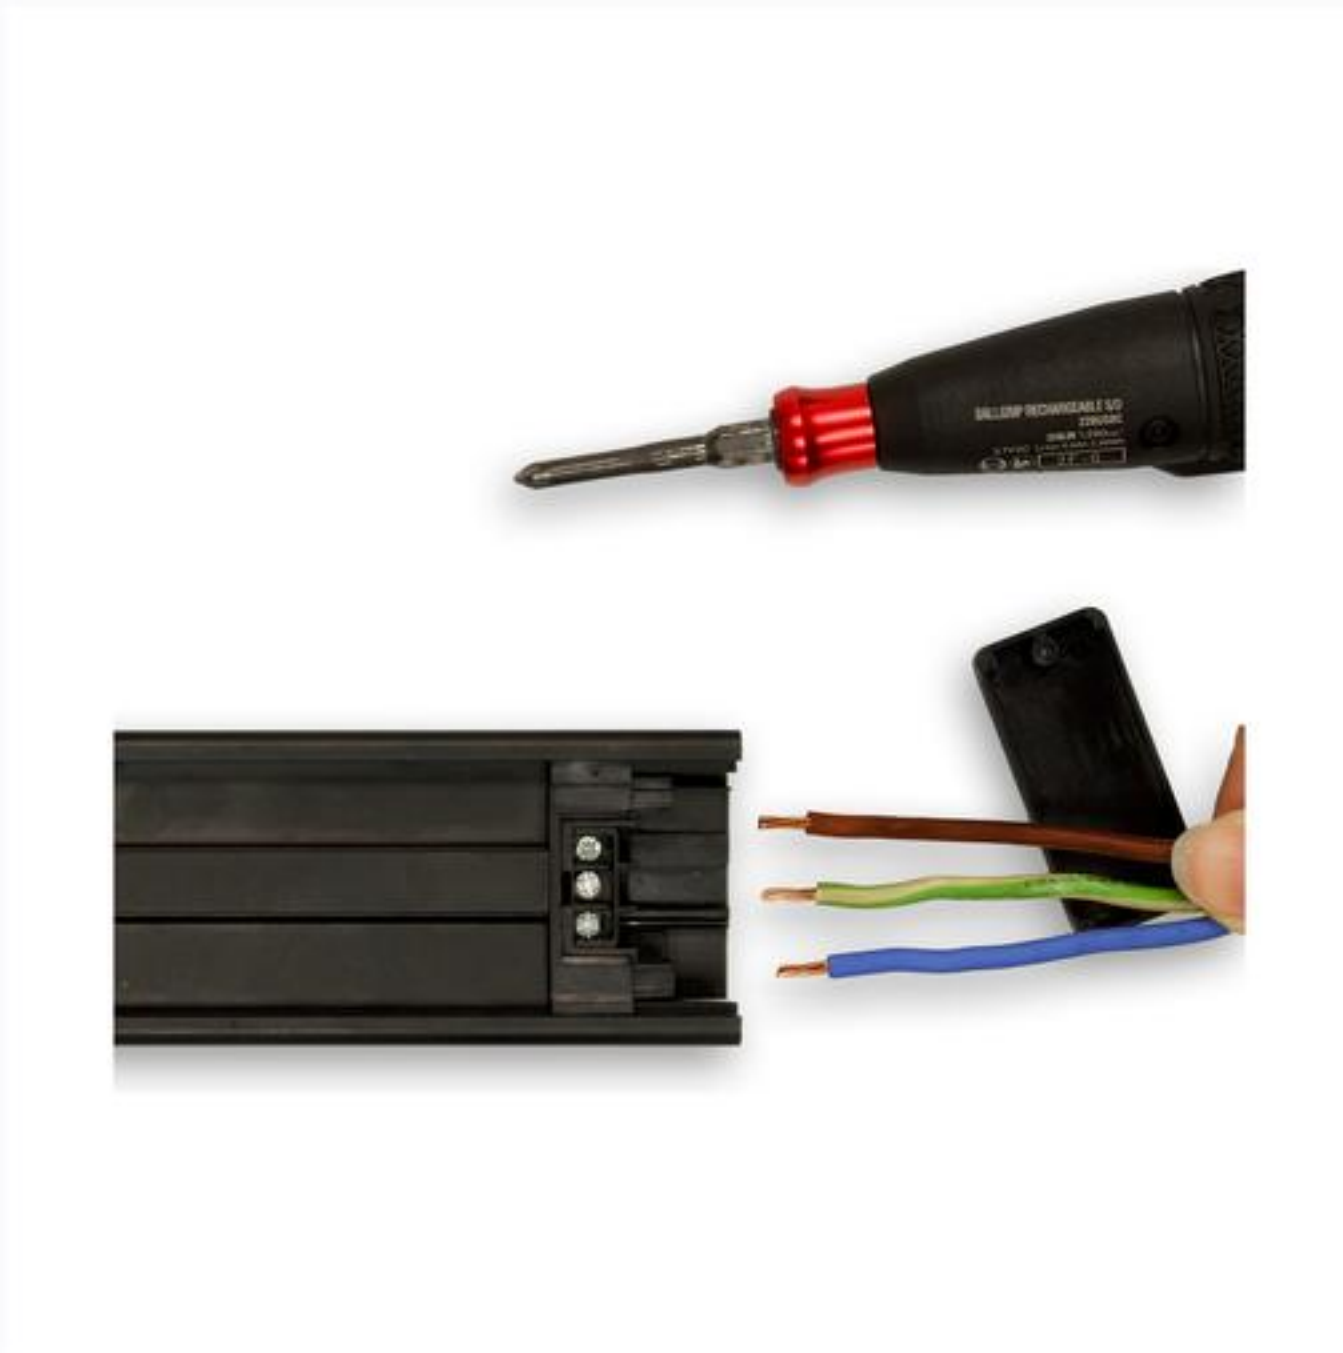

Decide which end the incoming supply cable will enter from. Unscrew the end cap on that side of the track.

### STEP 04

#### Remove the end cap

Gently pull the end cap away from the track core to expose the terminal block inside.

### STEP 05

#### Prepare the incoming cables

Strip 5 mm of insulation from each incoming supply cable, ready for termination.

### STEP 06

#### Connect the supply cables

Following the cable termination markings on the terminal block, connect the incoming supply cables to the correct terminals.

### STEP 07

#### Secure the cables to the terminal

Tighten each terminal screw firmly so every cable is held securely with a solid electrical connection.

### STEP 08

#### Hang the track into the retaining clips

Lift the track into position and hang it onto the retaining clips mounted on the wall.

### STEP 09

#### Reinstall the end cap

Fit the end cap back over the terminal block, tucking the cables neatly inside.

### STEP 10

#### Secure the end cap screws

Screw the end cap firmly back into place to fully enclose and protect the wiring.

### STEP 11

#### Secure the track to the clips

With firm, even pressure, press the track fully home into the retaining clips along its length until it clicks into place.

### STEP 12

#### Ready to use

Your Zen Track is installed. Restore power at the distribution board and it's ready to use.
